*“This book expertly pieces together a puzzle of global economic activity and explains how trade creates and reinforces detrimental social impacts and affects our social capital. Written by academics and practitioners and covering a wide range of often underrepresented topics, this book is a milestone in uncovering the true social effects of global trade.”*

**Dr. Thomas Wiedmann**

**School of Civil and Environmental Engineering, University of New South Wales, Sydney**

*“This book informs readers how to quantify attributes of specific supply chains and the corresponding ‘footprints’. It is vital reading for policy makers and business leaders wanting to make public the problems they have identified, and remedied, in their supply chains.”*

**Faye Duchin**

**Rensselaer Polytechnic Institute, Troy, USA**

It was around 2013 that researchers found ways to include qualitative social data (e.g., poverty, inequality and worker safety) into global environmental and economic input-output (IO) models capable of tracing global supply chains. This book compiles groundbreaking work on social indicators by the most prominent, multidisciplinary IO research groups from around the world and frames it in the real world of politics, human rights and business, demonstrating the power of IO to illuminate some of the world's most pressing problems. Edited by well-known researchers in the area, Joy Murray, Arunima Malik and Arne Geschke, the book will appeal to a broad academic and business audience. While many chapters include technical details and references for follow-up reading, readers can omit those sections and yet gain a deep appreciation of the power of IO to address seemingly intractable problems.

**Joy Murray** is a senior research fellow with the Integrated Sustainability Analysis (ISA) group at the University of Sydney's School of Physics. Before joining the ISA, Joy worked for over 25 years in education, pre-school to post-graduate. She has also worked with residents of government housing estates to collaboratively develop leadership capacity. In addition to contributing to numerous journal articles, she has edited four intellectually stimulating books on sustainability.

**Arunima Malik**, a research associate at the ISA, holds a bachelor's degree (molecular biology and genetics) with honours in plant cell biology, a master's degree in teaching and a PhD in sustainability assessment. Her research interests include full-chain sustainability analysis of new industries in the economy and triple-bottom-line, footprint and hybrid life cycle assessments. She is also working on the Australian virtual collaborative research platform in the area of social, environmental and economic sustainability assessment of biofuel production.

**Arne Geschke** is a researcher and scholarly teaching fellow at the ISA. He studied industrial mathematics at the University of Hamburg and the University of Bath. During his PhD at the ISA, he was part of the team that developed the then largest global MRIO database, Eora. He has mainly worked on streamlining and automating the complex procedures involved in compiling large-scale, global MRIO databases. He was also one of the key system designers of the Industrial Ecology Virtual Laboratory (IELab) software suite.
