"A great book covering the theoretical aspects of optical and luminescence properties of transition metals and lanthanides. Starting with the bachelor-level quantum physics to describe free transition metal and lanthanide ions, it covers the basics of crystal field theory, group theory, and the vibrating crystalline environment. The authors manage to keep the book at the graduate student level, making it accessible to the non-theorist and very well-suited for the interpretation and analysis of experimental data."

Prof. Pieter DorenbosDelft University of Technology, The Netherlands

This book describes in detail the main concepts of theoretical spectroscopy of transition metal and rare earth ions. It shows how the energy levels of different electron configurations are formed and calculated for the ions in a free state and in crystals, how group theory can help in solving main spectroscopic problems, and how the modern DFT-based methods of calculations of electronic structure can be combined with the semi-empirical crystal field models. The style of presentation makes the book helpful for a wide audience ranging from graduate students to experienced researchers.

Mikhail G. Brik received his PhD from Kuban State University (Russia) in 1995 and his DSc (habilitation) from the Institute of Physics, Polish Academy of Sciences (Poland) in 2012. Since 2007 he is a professor at the Institute of Physics, University of Tartu, Estonia. Before that, he worked at Kyoto University (Japan) from 2003 to 2007, Weizmann Institute of Science (Israel) in 2002, Asmara University (Eritrea) from 2000 to 2001, and Kuban State

University from 1995 to 2000. He is also a distinguished visiting professor at Chongqing University of Posts and Telecommunications (China) and Professor at Jan Długosz University (Poland). Since 2015 he serves as one of the editors of *Optical Materials* (Elsevier). Prof. Brik's scientific interests cover theoretical spectroscopy of transition metal and rare earth ions in optical materials, crystal field theory, and ab initio calculations of the physical properties of pure and doped functional compounds. He is a coeditor of two books and author of 12 book chapters and about 390 papers in international journals. According to Google Scholar (November 2019), he has more than 7500 citations with h index 41. He received the Dragomir Hurmuzescu Award of Romanian Academy in 2006 and the State Prize of the Republic of Estonia in the field of exact sciences in 2013. In 2018 he received the state professor title from the President of Poland.

Chong-Geng Ma received his PhD from University of Science and Technology of China (Hefei, China) in 2008. He has spent three years (2010-2013) as a postdoctoral researcher in Tartu (under the supervision of Prof. Brik). A specialist in crystal field theory and ab initio calculations, he has published one chapter in a book and more than 75 papers in international journals, which attracted more than 1600 citations. His h index is 20 according to the

ISBN 978-981-4800-56-3

database of Web of Science (November 2019). Currently he is a full professor at Chongqing University of Posts and Telecommunications (Chongqing, China) and a guest professor at Institute of Rare-Metal, Guangdong Academy of Sciences (Guangdong, China) as well. In 2018 he received the third prize in Chongqing Natural Science awards as the principal investigator.
